

Mock test

Date

No.

1

switch

pay attention to break;

`switch(...)` → it may be used to determine truth or falsehood, with 1 representing true and 0 representing false ⇒ case 0/1

++i & i++

both increment by 1 first; the former returns the value after incrementing, while the latter returns the value before incrementing.

⚠ when the loop stops, there's conditional check; don't forget the final value computed by `++i` or `i++`

!

means the opposite

i=1

`i=1` is not a comparison but an assignment, and its result is true.

variables

local → outer block → global

mantissa

positive → negative don't forget to plus 1.

random num.

- ⚠ `deno = ( )`, priority!
- `32767.0`
- when compared to a fraction, remember to write `3.0/16`
- `n & last e8`, so the result needs to `* 1.0!!!` `n * 1.0 / last` (whether * total)
- left boundary + the interval length multiplied by the proportion.

2

else

line breaks do not affect parsing

an `else` pairs with the nearest unmatched `if`

|| &&

`||` one correct → correct

`&&` both correct → correct

printf

`printf("i=%d, x=%d", x, i);`

priority

① () ② ! ③ * / % ④ + - ⑤ > < > = < = ⑥ == != ⑦ && ⑧ ||
